Calculation and Results

Plot a graph between $D_{n+m_1}^2 - D_{n+m_2}^2$ vs m_1-m_2 using the method of least squares.

Table 2 Calculation of radius of curvature, R, from the graph

$D^{2}_{n+m_{1}} - D^{2}_{n+m_{2}}$ (cm^{2}) from graph	m ₁ -m ₂	λ (cm) (5893×10 ⁻⁸)	$R = \frac{D^{2}_{n+m_{1}} - D^{2}_{n+m_{2}}}{4(m_{1} - m_{2})\lambda}$ (cm)
0.00284	0		-
0.022	1		93.33

0.139	7		84.24
1.158	8	2.00	83.78
0.177	9	Carlotte.	83.43

RMEAN = 85.98 cm

RESULT: Radius of cunvature = (85.98 ± 21.49) cm R VALUE CALCULATIONS:

$$(M_1 - M_2) = 1$$
; $\eta = 5893 \times 10^{-8} \text{ cm}$; $D_{n+m_1}^2 - D_{n+m_2}^2 = 0.022 \text{ cm}$
 $R = \frac{0.022 \times 10^8}{4 \times 1 \times 5893} = 93.33 \text{ cm}$.

$$(m_1 - m_2) = 2; \lambda = 5893 \times 10^{-8} \text{ cm}; D_{n+m_1}^2 - D_{n+m_2}^2 = 0.042 \text{ cm}$$

$$R = \frac{0.042 \times 10^8}{4 \times 2 \times 5893} = 89.09 \text{ cm}$$

Estimate error in R

The radius of curvature is calculated from Equation (3), viz.

$$R = \frac{D_{n+m_1}^2 - D_{n+m_2}^2}{4(m_1 - m_2)\lambda}$$

Since D_{n+m_1} and D_{n+m_1} are only measured, the maximum proportional error in R is given by

$$\frac{\delta R}{R} = \frac{\delta \left(D_{n+m_1}^2 - D_{n+m_2}^2\right)}{D_{n+m_1}^2 - D_{n+m_2}^2} = \frac{2(\delta D_{n+m_1})D_{n+m_1} + 2(\delta D_{n+m_1})D_{n+m_2}}{D_{n+m_1}^2 - D_{n+m_2}^2}$$

Since D_{n+m_1} or D_{n+m_2} is measured by taking the difference between the two readings of a so provided with a vernier, the maximum error in measuring each of these quantities is twice the vern constant i.e. $2\nu.c.$

Therefore, $\delta D_{\mu} = 2v.c$

Hence,
$$\frac{\delta R}{R} = 4v.c \frac{(D_{n+m_1} + D_{n+m_2})}{D_{n+m_1}^2 - D_{n+m_2}^2} = \frac{4v.c}{(D_{n+m_1} - D_{n+m_2})}$$

$$\frac{\delta R}{R} = \frac{4 (v \cdot c)}{D_{n+m_1} - D_{n+m_2}} = \frac{4 (0.001)}{0.016} = 0.25$$

EXPERIMENTAL ERROR (MAXIMUM)

Thus, experimental error is within limits

Newton SIBA SMARAK NOTES

RESULT

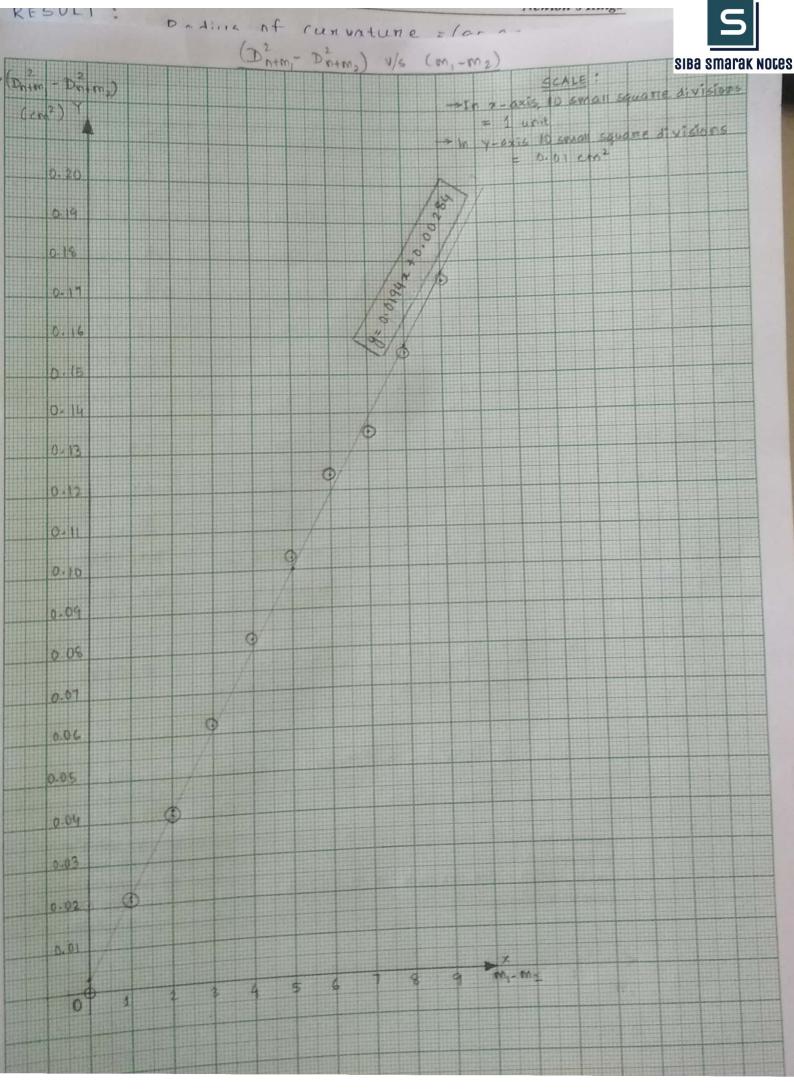

Radius of curvature = (85.98 ± 21.49) cm

DISCUSSION :

This expeniment uses the concept of interfenence of the light from two coherent sources, which here are produced from the same source. meflections take place, one has a Tr change in phase due to reflection from nanen to densen medium. The wavefronts Obtained are cincular giving them a look Like nings, with a central dank spot due to destructive interference at center.

Discussion

The Newton's ring experiment can be also used to find the wavelength of a monochromatic light. In this case, the radius of curvature of the convex surface of the given lens is supplied or is determined otherwise. By employing sodium light whose mean wavelength is 5893Å, R can (i) be determined from Eqn.(3), as in the present experiment. Then the same equation can be used
